

LEED Information for PVC Pipe Produced by North American Pipe

To Whom It May Concern:

North American Pipe Corporation produces pipe to a multitude of industry standards for applications in raw and potable water transmission and distribution, reclaim water transmission and distribution, sewage collection and transmission, irrigation, and drain/waste/vent systems. Approximately 98% of the rework material generated in the production of these products is either recycled in our own process or provided to third parties for incorporation into other goods.

The standards to which we produce and the listing bodies that monitor the production of these products (NSF, Underwriters Laboratories, Factory Mutual, and IAPMO) prohibit the incorporation of post-consumer recycled material into our products. Clean rework material from our own process is allowed. This material is typically less than 5% of the content in finished products.

North American Pipe Corporation manufactures PVC pipe in the following locations:

Booneville, Mississippi
Calvert City, Kentucky
Greensboro, Georgia
Janesville, Wisconsin
Leola, Pennsylvania
Litchfield, Illinois
Springfield, Kentucky
Wichita Falls, Texas
Yucca, Arizona

PVC pipe is designed and manufactured to have a useful life that surpasses 100 years. Because it will not corrode or wear out it, replacement of the installed product is generally only required when the needs of the system exceed the designed capacity.
